

## Registrations/Authorizations

The **EHSIntegrator Registration module** allows the definition of different types of registration and the recording of the following common elements and attributes for them:

- Registration type and a uniquely identifying registration number or code
- Research overview, reviewer comment, and anticipated start/end dates of work
- Activity types of the research, principal and associated work areas (labs) and assistants
- Chronological notes pertaining to the application
- Summary information about regulatory agency required permits
- Standard operating procedures
- Role information for other people (additional signatories, co-principals, etc.)

Meta data can be used to control which of the available common elements are enabled and should be shown for any given registration type.

The provision of common registration elements has two important purposes: 1) They allow for the common reporting and listing of all registration across all Registration Types for any given Principal. 2) They leave little to be implemented when creating new simple registration types.

We've also extended this module to handle Registration Type specific data for such types as, Bio Agents work, work involving Controlled Substances, Radiation Isotope work, and X-ray use.

## Metrics & Management

- See renewals coming due and create new versions that can be edited and resubmitted.
- List all applications for all registration types for all Principals.
